iQUILA

SOFTWARE DEFINED NETWORKS

iQUILA IN LEGAL

OUR CHALLENGE

We are a prominent law firm with a substantial global presence, operating 33 offices across North America, Europe, Asia, and the Middle East. Our offices are strategically located in major cities, including New York, London, Beijing, and Dubai, to better serve our diverse clientele. We employ nearly 2,100 lawyers world-wide, supported by a dedicated team of patent agents, benefits advisers, regulatory scientists, and other specialists. This brings our total number of legal professionals to over 2,500.

To ensure seamless connectivity and data management, we currently utilize ExpressRoute to link our 33 offices to Microsoft Azure, where all our data is securely stored. For remote access, our staff relied on IPSec VPN. We required a more robust remote access solution, to enhance security and improve the user experience of our remote workforce, in an increasingly digital world.

KEY CHALLENGES

Deployable on a large scale

Always-on connection

Robust security

Cost efficiency

THE SOLUTION

After evaluating numerous options, we opted for iQuila Cloud due to its extensive global footprint over the Microsoft Azure network, providing the necessary connectivity. We established a service in each of our office country locations and linked these services back to our Azure hosting environment. This setup allowed local staff to access the cloud service with low latency and fast connectivity to our resources within Micro-soft Azure. The always-on connection offered by iQuila Cloud enables all staff to perform full Active Directory logins to Microsoft Azure Active Directory, securing the endpoints. Additionally, all internet-bound data flows through the iQuila Cloud secure gateway, ensuring enhanced security.

KEY BENEFITS

Large-scale deployment

The iQuila Cloud client was simple to deploy, with several different deployment methods available. We deployed the Windows version using the MSI package and configured the client with a simple script, all pushed out via Microsoft Intune.

Always-on connection

The iQuila Client can be configured for an always-on connection. This feature allows the client to connect prior to user login, enabling all devices to be part of Active Directory. This also gives our IT team the ability to manage remote devices as if they were in the office, reducing the support needed for these devices.
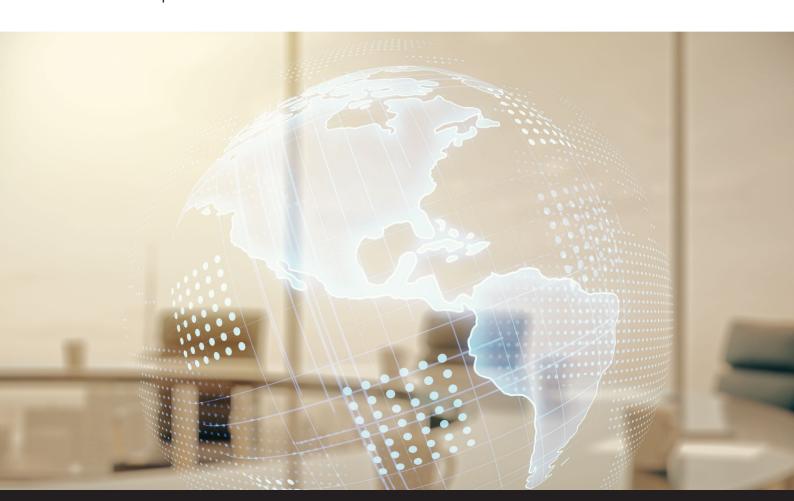

Robust security

As a large law firm, we take security very seriously. The iQuila Cloud solution offers strong encryption and allows full routing of all data from the device back to our servers, where we can filter and protect users from malicious content.

Cost efficiency

The implementation of iQuila Cloud has proven to be cost-efficient, streamlining our operations and enhancing our ability to support remote work without significant additional expenses.
